

# Chikyu Project Challenges Science, Technology and Operation

# Deep-sea Drilling Vessel "Chikyu"

(Built in 2005)

## D/V Chikyu Missions

## D/V Chikyu IODP scientific drilling records (as of March 2017)

Expeditions: 16    Drilling: 41 km

Deepest water depth record:  
6,928.5 m (Exp. 343)

Exp holes: 101

Cumulative collected core lengths: 5.6 km

Exp days: 911 days

Number of cores: 1057 cores

Deepest hole record: 3,058.5 m (Exp. 348)

# IODP

## International Ocean Discovery Program

*Exploring the Earth under the Sea*

*2013-2023*

- The Deep Biosphere and the Subseafloor Ocean
  - Deep Biosphere
  - Gas Hydrates
- Environmental Change, Process and Effect
  - Extreme Climates
  - Rapid Climate Change
- Solid Earth Cycle and Geodynamics
  - Continental Breakup and Sedimentary Basin Formation
  - Large Igneous Provinces
  - 21<sup>st</sup> Century Mohole
  - Seismogenic Zone

# IODP Expeditions Implemented by Chikyū

## IODP-CDEX Expeditions (2007-2016)

● Completed

● **Deep Coalbed  
Biosphere off Shimokita**  
Expedition 337

● **Japan Trench  
Fast Drilling  
Project (JFAST)**  
Expedition 343

● **T-Limit of the Deep Biosphere  
off Muroto**  
Expedition 370

● **DEEP HOT BIOSPHERE**  
Expedition 331

● **Nankai Trough  
Seismogenic Zone Experiment  
(NanTroSEIZE)**

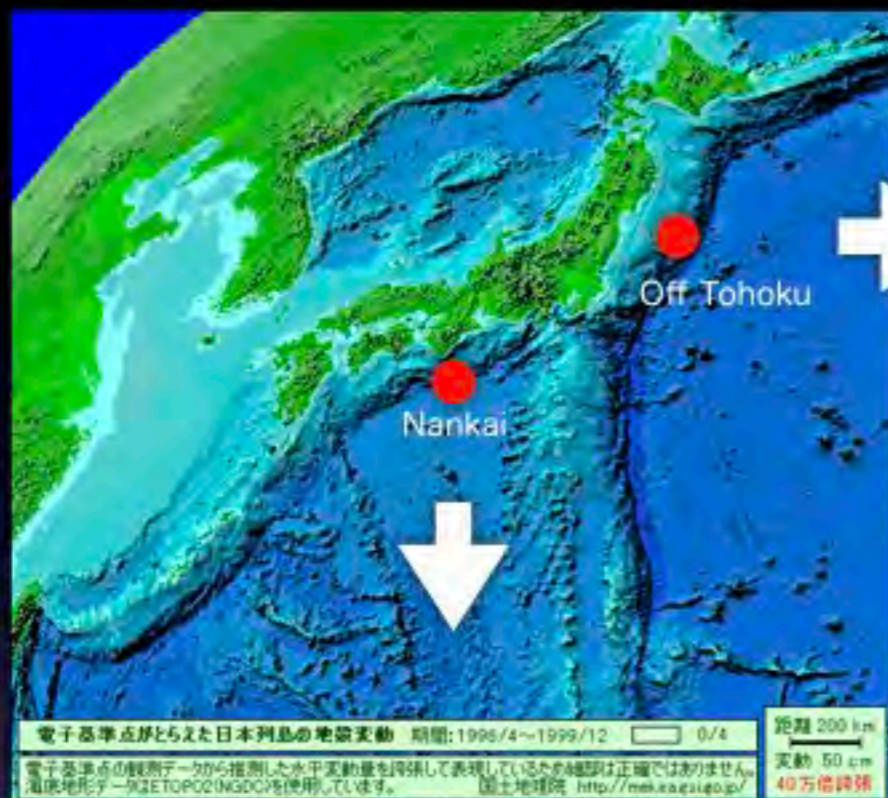

Expedition 314, 315, 316, 319, 322, 332,  
333, 326, 338, 348, 365

# Seismogenic Zone

## Nankai Trough and Off Tohoku

Crustal movement around Japan using a GNSS network observation. Horizontal exaggeration is 400K. (GSI)

**Conceptual image of sub-seafloor structure at the drilling site**  
Chikyu drilled down to the plate boundary fault, about 850.5 m below the seafloor under a water depth of 6889.5 m. Plate boundary fault rock samples were recovered from 648–844.5 m below the seafloor.

**Nankai Subduction Zone**

15 sites have been drilled and 2 sites have been installed borehole observatories. DONET (Dense Oceanfloor Network System for Earthquakes and Tsunamis) is under realtime operation now.

An example of LTBMS in Nankai boreholes. Slow slips are monitored with high resolution data.

A model of slow slip and large earthquake relationship. Obara & Kato (2016)

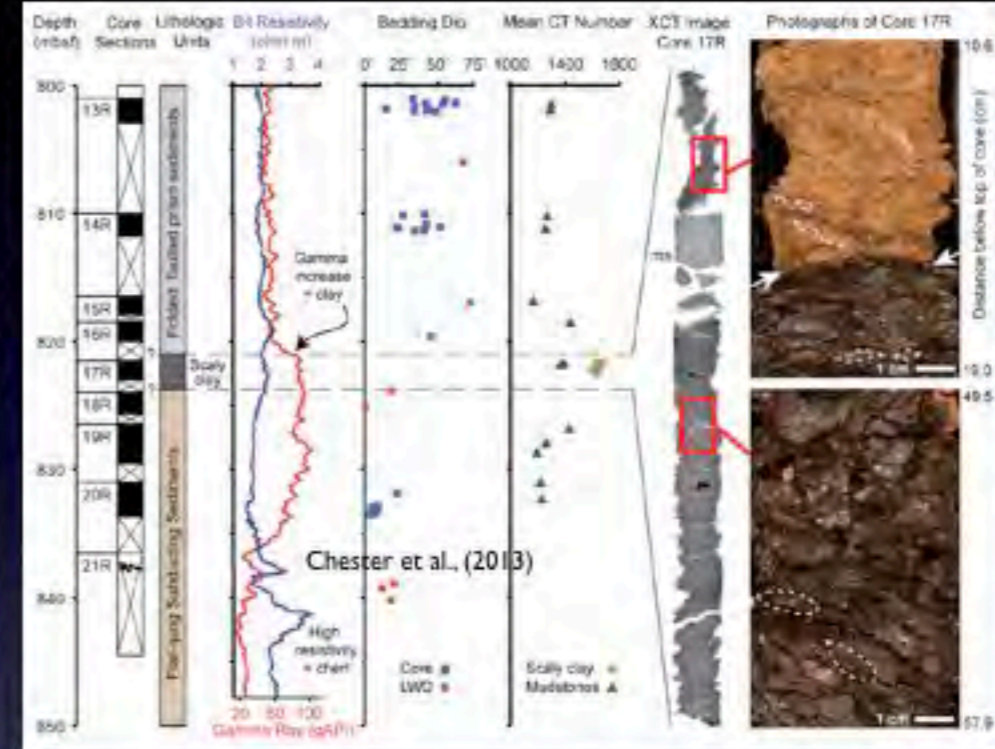

# Common Large Tsunami Generation Mechanism?

## A New Finding at the Toe of Accretionary Prisms both Nankai and Tohoku

When estimating the frictional heat generated during an earthquake by using drilling samples, it was greater than 400 °C. It is believed that high-speed slip occurs even near the trench axis. This finding requests to re-writing our text book.

Frictional heating at the fault boundary detected using a chain of precise thermistors.

3.11 seismic fault was thin (less than 5 m thick) and contains smectite more than 70%. It is a fundamental condition to cause "Thermal Pressurization". The mechanism significantly weaken the faults.

# Hydrothermal System Okinawa Trough

Accurate Drilling Technology at Extremely High Temp. Area

# CHIKYU Technological Challenges

## Open A New Scientific Horizon

- Deep Water Drilling Technology
  - Exp. 343 JFAST, Japan Trench (WD: 6883.5m + 856.5 mbsf) 
  - M9 earthquake fault coring, LWD and monitoring
- Deep Drilling Technology 
  - Exp. 348, Nankai Trough (3000 mbsf)
  - Accretionary Prism (complex geology) drilling
- Riser Drilling under High Speed Current Technology
  - NanTroSEIZE, Nankai Trough (~6kts)
  - To be reach the splay fault/plate boundary
- Borehole Monitoring System Development
  - Real-time Monitoring through a submarine cable network
  - Frictional heat measurement at M9 fault and Nankai-DONET
- Coring Technology
  - Hybrid Pressure Core Sampler, Gel-Coring System & Turbine Driven Coring System
  - Methane gas hydrate coring, micro-bio sampling & deep penetration
- State-of-the-art Laboratory
  - X-CT, P-Mag, ICP-MS, Micro-Bio, etc
  - High-resolution measurements

# Drilling into the Mantle

## Sample Return from Unexplored Interior of our Planet

### Challenge of Deep Water and Deep Penetration

- ★ New Riser Pipe for Deep-Water
  - ▶ CFRP Riser
- ★ Tough Drilling Pipe
  - ▶ 12,000m Class DP
- ★ Long-Life Drill Bit
- ★ High Temp. Drilling Fluid
  - ▶ > 300°C
- ★ High Temp. Logging Tools
- ★ Pilot Hole Drilling
  - ▶ Riser-less Drilling

# Challenge of Operation - 1

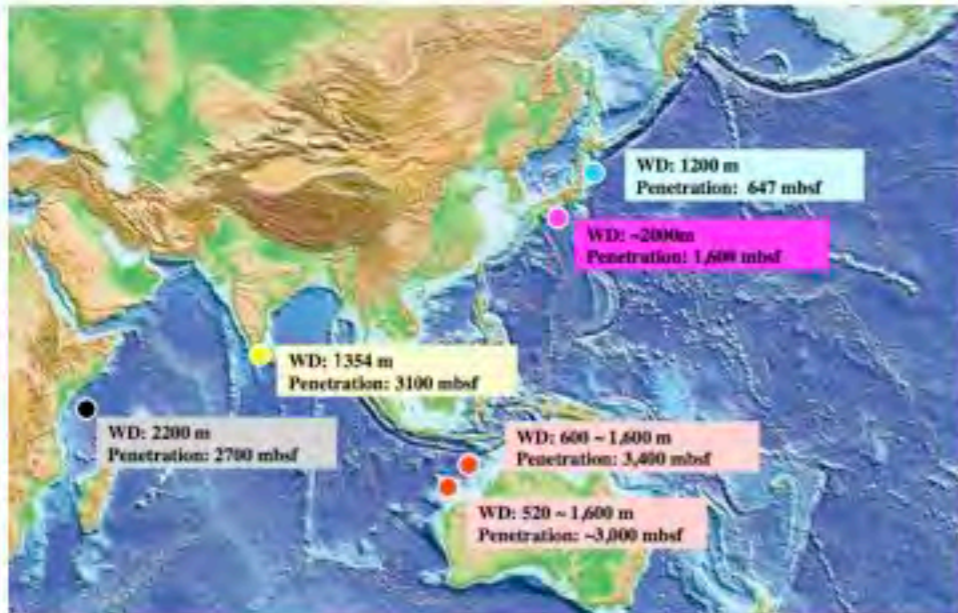

(secure sustainable operation **Budget**)

- <Pros>
- > Cost-cutting in operating expenses, i.e. personal cost, fuel, subcontractors and so on.
- <Cons>
- > Less opportunity for commercial drilling.
  - > Day rates will be much lower.

Actual Performance of Chikyu Operation (2005~2015)

	April	May	June	July	August	September	October	November	December	January	February	March	
2005	Overseas Cruise 1												
2006	R&D			Increased Chikyu Cruise 2				Overhaul Cycling Operations (4 times)					
2007	CO2R Activity				R&D Cruise		CO2R Exp. 11/13/14/15 (North Sea)			Annual Survey			
2008	PROSODYO/RESEARCH/TECHNICAL Support (Chikyu R&D)						Construction of Abrasive Thruster Gear				High Pressure Fluid		
2009	CO2R Exp. 16/17/18/19 (North Sea)					Supply Chain Cruise		Maintenance/Operation Training					
2010	Regular Inspection		Maintenance Cruise	CO2R Exp. 20 (North Sea)		CO2R Exp. 21 (North Sea)		CO2R Exp. 22 (North Sea)		CO2R Exp. 23	CO2R Exp. 24	Technical Exchange	
2011	Construction of repairing ship's bottom				CO2R Exp. 25								CO2R Exp. 26

2014	CO2R Exp. 34		SP		Maintenance							CO2R Exp. 35	
2015	CO2R Exp. 36				Regular Inspection		Open Ship @ Hokkaido		Overhaul Cruise		SP		CO2R Exp. 37

# Challenge of Operation - 2

(secure pre-, during-, post-drilling **Research Capability**)

## Pre-drilling Research

- shallow to deep crustal structure by 2D and 3D seismic survey
- hazard identification survey by high-res. seismic survey
- geo-tech core sampling
- topography and geophysical data
- met-ocean observation

R/V KAIMEI

## Keeping Our Focus on the Subseafloor

Hard-pressed funding agencies wonder whether marine seismic facilities are worth the investment. A recent survey gives a resounding yes.

University of Texas at Austin Ph.D. students Kelly Olsen and Brooklyn Gase work on recovering, cleaning, and storing 1 of 50 streamer depth control birds on the back deck of the R/V Langseth during a marine seismic survey cruise. Although relatively few scientists go to sea to collect such data themselves, the data from these surveys provide valuable information on subseafloor structures to a much wider scientific community. Credit: Nathan Bangs

EOS, AGU

## During-drilling Research

- walk-away VSP in 2D and 3D
- active monitoring
- bore-hole tomography

R/V Langseth

## Post-drilling Research

- active/passive monitoring by LTBMS
- in-situ bore-hole experiments

BMS

Long PC

# Challenge of Operation - 3

(promote next generation and capacity building)

Lecture Delivery to Science Museums

Invite students to the Chikyu

On-hand Lecture at the Chikyu Lab.

International Core School on the Chikyu

Symposiums

Open Ship Events

Collaborate w/ Mus.

Publications

TV Programs

Town Hall Mtg.

## Lessons Learned from Chikyu Operation

- Seek multi sources of fund
  - more collaboration with industries, governments (and maybe science founders)
- Need to establish a PROJECT which supported by international colleagues and ship operators
  - gather ships, equipment, technology and operators
  - share data, samples, knowledges and opportunities of education/training
  - establish a Win-Win-Win- ... relationship among contributors
- Educate next generation, early carrier people
  - otherwise no future for us

I'm happy to discuss this issue during the IRSO 2017 meeting in Yokosuka.  
Thank you!
